INTERNATIONAL SEARCH REPORT

International Application No
PCT/EP 95/02693

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 A61K31/00 A61K31/195

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category * | Citation of document, with indication, where appropriate, of the relevant passages | Relevant to claim No. |
|------------|---|-----------------------|
| X | EP,A,0 447 353 (CIBA-GEIGY AG) 18 September 1991 see the whole document --- | 1-10 |
| X | WO,A,94 10990 (BRITISH BIO-TECHNOLOGY LIMITED) 26 May 1994 see the whole document --- | 1-10 |
| X | WO,A,93 20047 (BRITISH BIO-TECHNOLOGY LIMITED) 14 October 1993 see the whole document --- | 1-10 |

| | | -/- |

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- 'A' document defining the general state of the art which is not considered to be of particular relevance
- 'E' earlier document but published on or after the international filing date
- 'L' document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- 'O' document referring to an oral disclosure, use, exhibition or other means
- 'P' document published prior to the international filing date but later than the priority date claimed

- 'T' later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- 'X' document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- 'Y' document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- '&' document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/EP 95/02693

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
REMARK: Although claims 4, 9 and 10 are directed to a method of treatment of the human/animal body the search has been based on the alleged effects of the compound/composition.
2. Claims Nos.: 1-10 because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
please see additional sheet!
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International Application No. PCT/EP95/02693

FURTHER INFORMATION CONTINUED FROM PCT/ISA/210

INCOMPLETE SEARCH

2. Obscurities,...etc.

The expressions "an inhibitor of the formation of human soluble CD23 (S-CD23)" and "an inhibitor of a matrix metalloprotease" are not proper definitions of chemical compounds in structural terms. The expression "disorders in which the overproduction of S-CD23 is implicated" is not a proper definition of a therapeutic application.

The references to the description in claims 9 and 10 do not meet the requirements of Rule 6.2(a)PCT.

USE OF INHIBITORS OF HUMAN S-CD23

This invention relates to a medical use and in particular to the use of inhibitors of the formation of soluble human CD23 for the treatment of conditions associated with excess production of soluble CD23 (s-CD23) such as autoimmune disease and allergy.

Matrix metalloproteases such as collagenase, stromelysin and gelatinase are known to be involved in connective tissue breakdown. Known classes of matrix metalloprotease inhibitors include derivatives of hydroxamic acid, phosphonates and thiols.

International Patent Application, Publication Number WO 93/20047 discloses that inhibitors of the matrix metalloproteases, especially derivatives of hydroxamic acid, are potentially useful for the treatment or prophylaxis of conditions involving such tissue breakdown, for example rheumatoid arthritis, osteoarthritis, osteopenias such as osteoporosis, periodontitis, gingivitis, corneal epidermal or gastric ulceration, and tumour metastasis or invasion.

WO 93/20047 discloses various derivatives of hydroxamic acid including those from the following patent publications: USP 4599361, EP-A-0236872, EP-A-0274453, WO 90/05716, WO 90/05719, WO 91/02716, EP-A-0489577, EP-A-0489579, EP-A-0497192 and WO 92/13831.

CD23 (the low affinity IgE receptor Fc_εRII, Blast 2), is a 45 kDa type II integral protein expressed on the surface of a variety of mature cells, including B and T lymphocytes, macrophages, natural killer cells, Langerhans cells, monocytes and platelets (Delespesse *et al.*, *Adv Immunol.*, 49 [1991] 149-191). There is also a CD23-like molecule on eosinophils (Grangette *et al.*, *J Immunol.*, 143 [1989] 3580-3588). CD23 has been implicated in the regulation of the immune response (Delespesse *et al.*, *Immunol Rev.*, 125 [1992] 77-97). Human CD23 exists as two differentially regulated isoforms, a and b, which differ only in the amino acids at the intracellular N-terminus (Yokota *et al.*, *Cell.*, 55 [1988] 611-618). In man the a isoform is found only on B-lymphocytes, whereas type b is found on all other cells capable of expressing CD23. However, expression of the b isoform on B-lymphocytes is inducible by IL4. Intact, cell bound CD23 (i-CD23) is known to undergo cleavage from the cell surface leading to the formation of a number of well-defined soluble fragments (s-CD23), which are produced as a result of a complex sequence of proteolytic events, the mechanism of which is still poorly understood (Bourget *et al.* *J Biol Chem.*, 269 [1994] 6927-6930). Although not yet proven, it is postulated that the major soluble fragments (Mr 37, 33, 29 and 25 kDa) of these proteolytic events, all of which retain the C-terminal lectin domain common to i-CD23, occur sequentially via initial formation of the 37 kDa fragment (Letellier *et al.*, *J Exp Med.*, 172 [1990] 693-700).

An alternative intracellular cleavage pathway leads to a stable 16 kDa fragment differing in the C-terminal domain from i-CD23 (Grenier-Brosette *et al*, *Eur J Immunol*, **22** [1992] 1573-1577).

Several activities have been ascribed to membrane bound i-CD23 in humans.

- 5 all of which have been shown to play a role in IgE regulation. Particular activities include: a) antigen presentation, b) IgE mediated eosinophil cytotoxicity, c) B cell homing to germinal centres of lymph nodes and spleen, and d) downregulation of IgE synthesis (Delespesse *et al*, *Adv Immunol*, **49**, [1991] 149-191). The three higher molecular weight soluble CD23 fragments (Mr 37, 33 and 29 kDa) have
 - 10 multifunctional cytokine properties which appear to play a major role in IgE production. Thus, the excessive formation of s-CD23 has been implicated in the overproduction of IgE, the hallmark of allergic diseases such as extrinsic asthma, rhinitis, allergic conjunctivitis, eczema, atopic dermatitis and anaphylaxis (Sutton and Gould; *Nature*, **366**, [1993] 421-428). Other biological activities attributed to s-CD23
 - 15 include the stimulation of B cell growth and the induction of the release of mediators from monocytes. Thus, elevated levels of s-CD23 have been observed in the serum of patients having B-chronic lymphocytic leukaemia (Sarfati *et al*, *Blood*, **71** [1988] 94-98) and in the synovial fluids of patients with rheumatoid arthritis (Chomarat *et al*, *Arthritis and Rheumatism*, **36** [1993] 234-242).
- 20 Because of these various properties of CD23, compounds which inhibit the formation of s-CD23 should have twofold actions of a) enhancing negative feedback inhibition of IgE synthesis by maintaining levels of i-CD23 on the surface of B cells, and b) inhibiting the immunostimulatory cytokine activities of higher molecular weight soluble fragments (Mr 37, 33 and 29 kDa) of s-CD23.

- 25 It has now surprisingly been found that compounds which inhibit the action of matrix metalloproteases (eg collagenase, stromelysin and gelatinase) are effective inhibitors of the release of human soluble CD23 transfected into mammalian cell culture systems. It is also indicated that such compounds inhibit the formation of IgE by human peripheral blood mononuclear cells in response to IL4 and stimulation with
- 30 an antibody to CD40. Inhibitors of the matrix metalloproteases are therefore potentially useful for the treatment or prophylaxis of disorders such as allergy and autoimmune disease in which the overproduction of s-CD23 is implicated. Known classes of matrix metalloprotease inhibitors include derivatives of hydroxamic acid, phosphonic acid and thiols, all of which have been shown to inhibit CD23 proteolysis.

- 35 Accordingly, the present invention provides the use of an inhibitor of the formation of human soluble CD23, such as an inhibitor of matrix metalloproteases, for the production of a medicament for the treatment or prophylaxis of disorders such as allergy and autoimmune disease in which the overproduction of s-CD23 is implicated.

In a further aspect the invention provides a method for the treatment or prophylaxis of disorders such as allergy and autoimmune disease in which the overproduction of s-CD23 is implicated, which method comprises the administration of an inhibitor of the formation of soluble human CD23, such as an inhibitor of matrix metalloproteases, to a human or non-human mammal in need thereof.

The invention also provides a pharmaceutical composition for the treatment or prophylaxis of disorders such as allergy and autoimmune disease in which the overproduction of s-CD23 is implicated which comprises an inhibitor of the formation of soluble human CD23, such as an inhibitor of matrix metalloproteases and optionally a pharmaceutically acceptable carrier therefor.

Suitable matrix metalloprotease inhibitors are set out in the Table and include the hydroxamic acid derivatives disclosed in WO 90/05716, WO 90/05719, WO 91/02716, WO 92/13831, WO 93/20047, EP-A-0236872, EP-A-0274453, EP-A-0489577, EP-A-0489579, EP-A-0497192 and USP 4599361.

Suitable matrix metalloprotease inhibitors also include the thiols and phosphonic acids disclosed in EP 273689 and EP320118.

The contents of WO 90/05716, WO 90/05719, WO 91/02716, WO 92/13831, WO 93/20047, EP-A-0236872, EP-A-0274453, EP-A-0489577, EP-A-0489579, EP-A-0497192, USP 4599361, EP 273689 and EP320118, and the other patent publications referred to in the Table, are incorporated herein by reference, including the specific examples disclosed in these patent publications.

Particular matrix metalloprotease inhibitors include the compounds disclosed hereinafter in the Procedures section.

Favoured matrix metalloprotease inhibitors include Example 2 of WO 90/05719 and Example 1 of EP 0497192.

It is to be understood that the pharmaceutically acceptable salts, solvates and other pharmaceutically acceptable derivatives of the above mentioned matrix metalloproteases inhibitors are also included in the present invention.

The matrix metalloprotease inhibitors mentioned herein may exist in several different isomeric forms, including stereoisomeric forms. Unless specifically stated to the contrary herein with respect to particular compounds, all isomers including stereoisomers and mixtures of isomers, such as racemic mixtures, are included within the present invention.

The matrix metalloprotease inhibitors of the invention may be prepared by use of any appropriate conventional method, for example the matrix metalloprotease inhibitors disclosed in patent publications WO 90/05716, WO 90/05719, WO 91/02716, WO 92/13831, WO 93/20047, EP-A-0236872, EP-A-0274453, EP-A-0489577, EP-A-0489579, EP-A-0497192 and USP 4599361, EP 273689 and EP320118 may be prepared by the methods disclosed therein.

The isomers, including stereoisomers, of the matrix metalloprotease inhibitors of the present invention may be prepared as mixtures of such isomers or as individual isomers. The individual isomers may be prepared by any appropriate method, for example individual stereoisomers may be prepared by stereospecific chemical synthesis starting from chiral substrates or by separating mixtures of enantiomers using known methods.

5 It is preferred that the matrix metalloprotease inhibitors are isolated in substantially pure form.

As used herein the term "matrix metalloprotease inhibitor" and equivalent 10 terms means any compound which inhibits any member of the family of zinc and calcium dependent endopeptidases (matrix metalloproteases) that have the ability to degrade components of the connective tissue matrices. Matrix metalloproteases and their inhibition are discussed by *inter alia* Hooper, FEBS Letters 1994, 354,1-6; Gordon et al., Clinical and Experimental Rheumatology 15 1993, 11(Suppl. 8), S91-S94; Woessner, FASEB 1991, 5, 2145-2154; and Birkedal-Hansen, Critical Reviews in Oral Biology and Medicine 1993, 4(2), 197-250. Assays for inhibition of collagenase, stromelysin, and gelatinase are described in WO 90/05719, page 67, WO 90/05719, page 68, and EP-A-0 489 577, pages 25-26, respectively. The present invention comprehends the use of 20 compounds which are deemed active in any one of these assays, as well as the specific compounds set out in the Table.

As stated herein an inhibitor of the formation of soluble human CD23, such as a matrix metalloprotease inhibitor, has useful medical properties. Preferably the active compounds are administered as pharmaceutically 25 acceptable compositions.

The compositions are preferably adapted for oral administration. However, they may be adapted for other modes of administration, for example in the form of a spray, aerosol or other conventional method for inhalation, for treating respiratory tract disorders; or parenteral administration for patients 30 suffering from heart failure. Other alternative modes of administration include sublingual or transdermal administration.

The compositions may be in the form of tablets, capsules, powders, granules, lozenges, suppositories, reconstitutable powders, or liquid preparations, such as oral or sterile parenteral solutions or suspensions.

35 In order to obtain consistency of administration it is preferred that a composition of the invention is in the form of a unit dose.

Unit dose presentation forms for oral administration may be tablets and capsules and may contain conventional excipients such as binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, or polyvinylpyrrolidone;

fillers, for example lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tabletting lubricants, for example magnesium stearate; disintegrants, for example starch, polyvinylpyrrolidone, sodium starch glycollate or microcrystalline cellulose; or pharmaceutically acceptable wetting agents such as sodium lauryl sulphate.

The solid oral compositions may be prepared by conventional methods of blending, filling or tabletting. Repeated blending operations may be used to distribute the active agent throughout those compositions employing large quantities of fillers. Such operations are of course conventional in the art. The tablets may be coated according to methods well known in normal pharmaceutical practice, in particular with an enteric coating.

Oral liquid preparations may be in the form of, for example, emulsions, syrups, or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, for example sorbitol, syrup, methyl cellulose, gelatin, hydroxyethylcellulose, carboxymethylcellulose, aluminium stearate gel, hydrogenated edible fats; emulsifying agents, for example lecithin, sorbitan monooleate, or acacia; non-aqueous vehicles (which may include edible oils), for example almond oil, fractionated coconut oil, oily esters such as esters of glycerine, propylene glycol, or ethyl alcohol; preservatives, for example methyl or propyl p-hydroxybenzoate or sorbic acid; and if desired conventional flavouring or colouring agents.

For parenteral administration, fluid unit dosage forms are prepared utilizing the compound and a sterile vehicle, and, depending on the concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions the compound can be dissolved in water for injection and filter sterilized before filling into a suitable vial or ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, a preservative and buffering agents can be dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being dissolved, and sterilization cannot be accomplished by filtration. The compound can be sterilized by exposure to ethylene oxide before suspending in the sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

Compositions of this invention may also suitably be presented for administration to the respiratory tract as a snuff or an aerosol or solution for a

nebulizer, or as a microfine powder for insufflation, alone or in combination with an inert carrier such as lactose. In such a case the particles of active compound suitably have diameters of less than 50 microns, preferably less than 10 microns for example diameters in the range of 1-50 microns, 1-10 microns

5 or 1-5 microns. Where appropriate, small amounts of other anti-asthmatics and bronchodilators, for example sympathomimetic amines such as isoprenaline, isoetharine, salbutamol, phenylephrine and ephedrine; xanthine derivatives such as theophylline and aminophylline and corticosteroids such as prednisolone and adrenal stimulants such as ACTH may be included.

10 The compositions may contain from 0.1% to 99% by weight, preferably from 10-60% by weight, of the active material, depending upon the method of administration. A preferred range for inhaled administration is 10-99%, especially 60-99%, for example 90, 95 or 99%.

15 Microfine powder formulations may suitably be administered in an aerosol as a metered dose or by means of a suitable breath-activated device.

Suitable metered dose aerosol formulations comprise conventional propellants, cosolvents, such as ethanol, surfactants such as oleyl alcohol, lubricants such as oleyl alcohol, desiccants such as calcium sulphate and density modifiers such as sodium chloride.

20 Suitable solutions for a nebulizer are isotonic sterilised solutions, optionally buffered, at for example between pH 4-7, containing up to 20mg/ml of compound but more generally 0.1 to 10mg/ml, for use with standard nebulisation equipment.

An effective amount will depend on the relative efficacy of the 25 compounds of the present invention, the severity of the disorder being treated and the weight of the sufferer. Suitably, a unit dose form of a composition of the invention may contain from 0.1 to 1000mg of a compound of the invention (0.001 to 10mg via inhalation) and more usually from 1 to 500mg, for example 1 to 25 or 5 to 500mg. Such compositions may be administered from 1 to 6 times a day, more usually from 2 to 4 times a day, in a manner such that the 30 daily dose is from 1mg to 1g for a 70 kg human adult and more particularly from 5 to 500mg. That is in the range of about 1.4×10^{-2} mg/kg/day to 14 mg/kg/day and more particularly in the range of about 7×10^{-2} mg/kg/day to 7 mg/kg/day.

TABLE

The following examples illustrate the invention but do not limit it in any way.

Preparations:

5

Preparation 1: [4-(N-Hydroxyamino)-2-(R)-Isobutyl-3-(S)-(2-thiophenethiomethyl)succinyl]-*(S*)-phenylalanine-N-methylamide, sodium salt

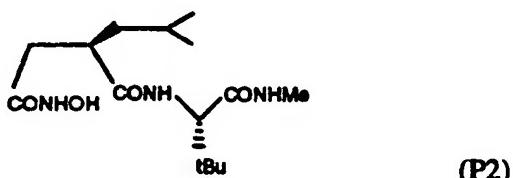

10

This is prepared according to the procedure disclosed in WO 90/05719 (see example 11, the free acid being prepared in example 2).

15

Preparation 2: (R)-[Hydroxycarbamoylmethyl]-4-methylvaleryl]-N¹, 3-dimethyl-(S)-valinamide.

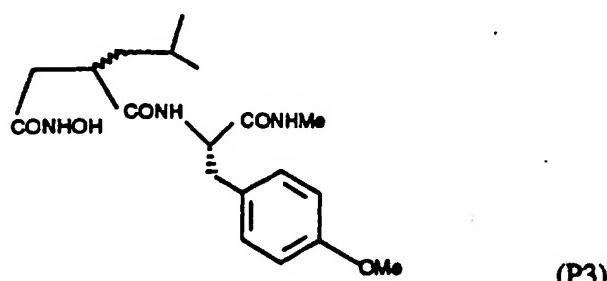

20

This is prepared according to the procedure disclosed in EP 0497192 (see example 1).

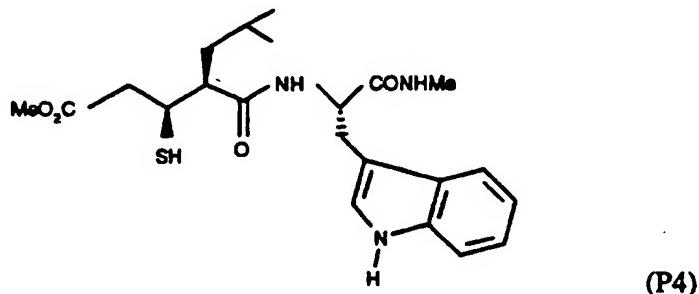

Preparation 3: N-[3-(N'-Hydroxycarboxamido)-2-(2-methylpropyl)-propanoyl-(S)-O-methyl-L-tyrosine-N-methylamide

25

This is prepared according to the procedure disclosed in USP 4599361 (see example 1).

Preparation 4: Methyl 3-(S)-mercaptop-6-methyl-4-(S)-[[[1(S)-[(methylamino)carbonyl]-2-(3-indolyl)ethyl]amino]carbonyl]heptanoate

This is prepared according to the procedure disclosed in EP 273689 and J.
10 Medicinal Chemistry 1993, 36, 4030-40 (see compound 56).

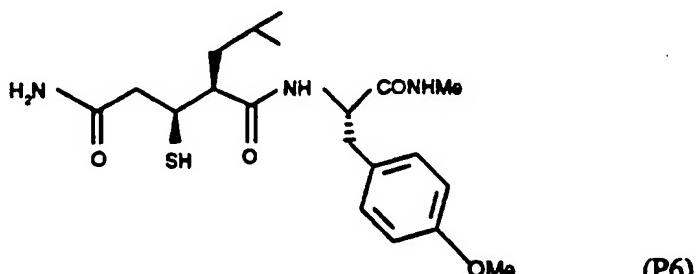

Preparation 5: Isopropyl 3-(S)-mercaptop-6-methyl-4-(S)-[[[1(S)-[(methylamino)carbonyl]-2-(3-indolyl)ethyl]amino]carbonyl]heptanoate

15

(P5)

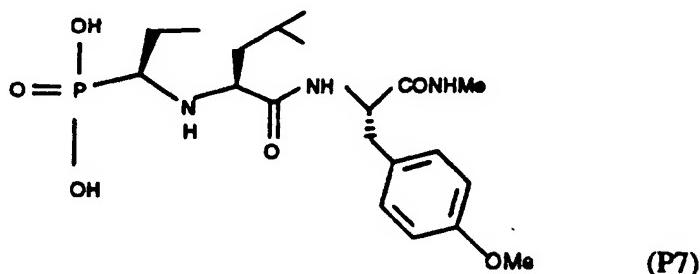

This is prepared according to the procedures disclosed in EP 273689.

Preparation 6: 3-(S)-Mercapto-N¹-(1-(S)-[methylamino)carbonyl]-2-(4-methoxyphenyl)ethyl]-2-(S)-(2-methylpropyl)pentanediamide

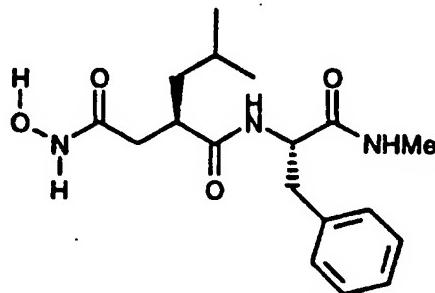

This is prepared according to the procedure disclosed in J. Medicinal Chemistry *ibidem* (see compound 47a).

5 **Preparation 7: N-[N-((S)-1-Phosphonopropyl)-(S)-leucyl]-Q-methyl-(S)-tyrosine N-methylamide**

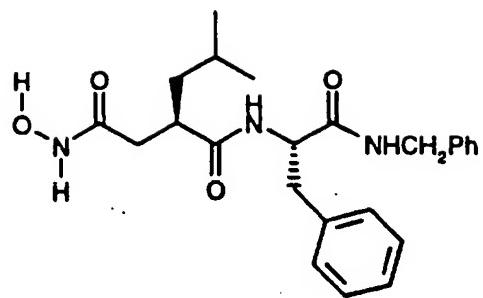

- 10 This is prepared according to the procedure disclosed in EP 320118 and J. Medicinal Chemistry 1994, 37, 158-169 (see compound 12).

15 **Preparation 8: N-[3-(Hydroxycarboxamido)-2R-(2-methylpropyl)propanoyl-(S)-phenylalanine-N-methylamide**

- 20 This is prepared by hydrogenolysis (using Pd/BaSO₄ as catalyst) of the precursor benzhydroxamate, itself prepared from the analogous carboxylic acid and O-benzylhydroxylamine using similar methodology to that described in WO 90/05719 example 1g

25 **Preparation 9: N-[3-(Hydroxycarboxamido)-2R-(2-methylpropyl)propanoyl-(S)-phenylalanine-N-benzylamide**

This is prepared from the precursor carboxylic acid and O-trimethylsilylhydroxylamine using similar methodology to that described in

- 5 WO 90/05719 example 1g but with bromo-tris-pyrrolidino-phosphonium hexafluorophosphate replacing water soluble carbodiimide as coupling agent.

BIOLOGICAL TEST METHODS

Procedure 1: The ability of test compounds to inhibit the release of soluble CD23

5 was investigated by use of the following procedure.

Adherent Chinese Hamster Ovary cells which had been transfected with the alpha form of CD23 were grown in microtitre plates. Cells were grown to confluence in α -MEM medium with 10% foetal calf serum, 2mM glutamine containing 800 micro g/ml G418. Medium was removed and the cells washed with sterile phosphate buffered saline. Test compounds were dissolved in dimethyl sulphoxide at a stock concentration of 20mM, then diluted 1 in 200 with α -MEM containing 800 micro g/ml G418 (no foetal calf serum). 100ml of the diluted compounds were added to the adherent cells in triplicate wells. Appropriate control cultures were set up in triplicate. The plates were incubated for 6 hours at 37°C, 95% air/5% CO₂ in a
 10 humidified incubator, then centrifuged at 200x g for 3 minutes. A specific ELISA for CD23, obtained from The Binding Site Limited, Institute of Research and Development, Birmingham England, was used to measure CD23 levels in the culture supernatants.
 15

The average concentration (IC₅₀) of test compound which inhibits the release
 20 of soluble CD23 by 50% relative to the control culture was determined.

Results

| Test Compound No. | IC ₅₀ (microM) |
|----------------------|---------------------------|
| P1 | 0.05 |
| P2 | 0.05 |
| P3 | 3.35 |
| P4 | 2.2 |
| P5 | 60 |
| P6 | 60 |
| P7 | 30 |

25

Procedure 2:

The ability of test compounds to inhibit the formation of human IgE *in vitro* was investigated using the following procedure:

- Human peripheral blood mononuclear cells were separated by centrifugation over Ficoll-Paque (Pharmacia). The cells were suspended in RPMI 1640 medium containing 10% foetal calf serum, 2mM glutamine, 50 microM 2-mercaptoethanol and 50 micro g/ml gentamycin (TCM) at a concentration of 1.25×10^6 cells/ml. 800 micro l of the cell suspension were aliquoted into the wells of a 48 well plate. 100 micro l of TCM or IL4 at 500ng/ml was added in quadruplicate to the appropriate wells, followed by 100 micro l of TCM or 10x the final concentration of compound under investigation. Test compounds are dissolved in dimethylsulphoxide (DMSO) at a stock dilution of
- 10 10^{-2} M diluted 1 in 100 in TCM and then as above. The plates are incubated for 12 days at 37°C in a 95% air/5% CO₂ humidified incubator. At the end of the culture period the supernatants were removed with the wells and centrifuged (200xg for 10 minutes) to remove any non-adherent cells. There was no toxicity as assessed by trypan blue dye exclusion. The IgE concentration in the supernatants was measured
- 15 by ELISA.

Results

| | | IgE ng/ml (mean +/- sem) |
|--------------|-------------|--------------------------|
| TCM | | 0.25 +/- 0.08 |
| IL4 (5ng/ml) | | 72.4 |
| IL4 with P1: | 10^{-5} M | 3.2 +/- 1.9 |
| | 10^{-6} M | 21.3 +/- 16.5 |
| | 10^{-7} M | 68.8 +/- 21.8 |

Procedure 3

- 20 The ability of test compounds to inhibit the formation of human IgE *in vitro* was investigated using the following procedure:
- Human tonsillar B lymphocytes were suspended in RPMI 1640 medium containing 10% foetal calf serum, 2mM glutamine, 50 micro M 2-mercaptoethanol and 50 micro g/ml gentamycin (TCM) at a concentration of 1.25×10^6 cells/ml. 800 micro l of the cell suspension were aliquoted into the wells of a 48 well plate. 100 micro l of TCM or IL4 at 100ng/ml and antibody to CD40 at 10 microg/ml was added in quadruplicate to the appropriate wells, followed by
- 25 100 micro l of TCM or 10x the final concentration of compound under investigation. Test compounds are dissolved in DMSO at a stock dilution of 10^{-2} M diluted 1 in 100 in TCM and then as above. The plates are incubated for 11 days at 37°C in a 95% air/5% CO₂ humidified incubator. At the end of the culture period the supernatants were removed from the wells and centrifuged (200xg for 10 minutes) to remove any
- 30

non-adherent cells. There was no toxicity as assessed by trypan dye exclusion. The IgE concentration in the supernatants was measured by ELISA.

Results

| | IgE ng/ml (mean +/- sem) |
|--|--------------------------|
| TCM | 1.9 |
| IL4 (10ng/ml) and anti CD40 (1 micro g/ml) | 11.7 +/- 1.1 |
| IL4 with P1: | |
| 10 ⁻⁵ M | 2.9 +/- 0.2 |
| 10 ⁻⁶ M | 4.3 +/- 0.6 |
| 10 ⁻⁷ M | 6.2 +/- 0.5 |

Claims

1. Use of an inhibitor of the formation of human soluble CD23 (s-CD23) for the manufacture of a medicament for use in the treatment or prophylaxis of disorders in which the overproduction of s-CD23 is implicated.
- 5
2. Use according to Claim 1, wherein the inhibitor of the formation of s-CD23 is an inhibitor of a matrix metalloprotease.
- 10 3. Use according to Claim 1 or 2, for the manufacture of a medicament for use in the treatment or prophylaxis of allergy or autoimmune disease.
4. A method for the treatment or prophylaxis of disorders in which the overproduction of s-CD23 is implicated, which method comprises the administration of an effective amount of an inhibitor of the formation of human soluble CD23 to a human or non-human mammal in need thereof.
- 15
5. A pharmaceutical composition for the treatment or prophylaxis of disorders in which the overproduction of s-CD23 is implicated, which comprises an inhibitor of the formation of human soluble CD23.
- 20
6. A pharmaceutical composition according to Claim 5, further comprising a pharmaceutically acceptable carrier.
- 25 7. A pharmaceutical composition according to Claim 5 or 6, for use in the treatment or prophylaxis of allergy or autoimmune disease.
8. A pharmaceutical composition according to any one of Claims 5 to 7, wherein the inhibitor of the formation of s-CD23 is an inhibitor of a matrix metalloprotease.
- 30
9. Use according to any one of Claims 1 to 3, a method according to Claim 4, or a pharmaceutical composition according to any one of Claims 6 to 8, substantially as hereinbefore described with reference to the Table.
- 35 10. Use according to any one of Claims 1 to 3, a method according to Claim 4, or a pharmaceutical composition according to any one of Claims 6 to 8, substantially as hereinbefore described in any one of Preparations 1 to 9.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/EP 95/02693

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
REMARK: Although claims 4, 9 and 10 are directed to a method of treatment of the human/animal body the search has been based on the alleged effects of the compound/composition.
2. Claims Nos.: 1-10 because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
please see additional sheet!
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International Application No. PCT/EP95/02693

FURTHER INFORMATION CONTINUED FROM PCT/ISA/210

INCOMPLETE SEARCH

2. Obscurities,...etc.

The expressions "an inhibitor of the formation of human soluble CD23 (S-CD23)" and "an inhibitor of a matrix metalloprotease" are not proper definitions of chemical compounds in structural terms. The expression "disorders in which the overproduction of S-CD23 is implicated" is not a proper definition of a therapeutic application.

The references to the description in claims 9 and 10 do not meet the requirements of Rule 6.2(a)PCT.
